

Notes Section 1.1 – Numbers, Data, and Problem Solving

Lesson Objectives

1. Classify real numbers
2. Convert a number from standard notation to scientific notation
3. Convert a number from scientific notation to standard notation
4. Use a calculator for computations involving scientific notation
5. Calculate Percent Change

A. Classifying Real Numbers

1. _____ numbers – the **counting** numbers $\{1, 2, 3, \dots, \infty\}$
 - Includes any number that can **simplify** to a natural number
 - Examples: $\frac{4}{2}, \sqrt{9}, \frac{25}{5}, \sqrt{49}$, etc.
2. _____ numbers – include _____ and the **natural** numbers $\{0, 1, 2, 3, \dots, \infty\}$
 - Think “_____” – write the “o” in the word “whole” with a zero instead
 - Includes any number that can **simplify** to a whole number
3. _____ – **whole** numbers & _____ (negatives) $\{-\infty, \dots, -3, -2, -1, 0, 1, 2, 3, \dots, \infty\}$
 - Sort of like “mile markers” on a number line; often used for reference in graphing
 - Includes any number that can **simplify** to an integer
 - Examples: $-\sqrt{4}, -\frac{33}{11}, -\sqrt{121}, -\frac{48}{6}$, etc., or examples from **natural** numbers
 - CAUTION! Just because a number is *negative* doesn’t necessarily mean it’s an integer!
 - They’re “pretty” numbers. With integers, remember “ahh!,” not “eww!”
4. _____ numbers – can be written as a **ratio** (fraction, denominator not zero)
 - Includes all **integers**
 - Includes some (not all!) of the numbers _____ the integers
 - Includes **all** forms of _____ (that don’t contain irrational numbers), positive or negative
 - _____ fraction (smaller/larger) – Examples: $-\frac{4}{7}, \frac{2}{5}$, etc.
 - _____ fraction (larger/smaller) – Examples: $-\frac{123}{6}, \frac{1245}{1108}$, etc.
 - _____ number – Examples: $-7\frac{3}{11}, 29\frac{17}{67}$, etc.
 - Includes some (not all) types of decimal numbers, positive or negative
 - All _____ **decimals** – they stop eventually
 - Examples: -12.93, -6.1, -0.4556, 0.23, 4.51, 67.88421, etc.
 - All _____ **decimals** – go on forever, but in a repeatable pattern
 - Examples: $-0.\overline{4}, -0.\overline{26}, -0.14\overline{67}, 0.\overline{43}, 2.\overline{7}$, etc.

Notes Section 1.1 – Numbers, Data, and Problem Solving

5. Irrational numbers – number that is **not** rational (can't be written as a fraction)

- Includes any _____ that doesn't "work," or simplify to a rational number, pos or neg
 - Examples: $-\sqrt{88}$, $-\sqrt{50}$, $-6\sqrt{20}$, $-\sqrt[3]{12}$, $\sqrt[4]{2}$, $\sqrt{15}$, $3\sqrt{62}$, etc.
- Includes other numbers, like _____ (called "phi" or φ), and anything that includes them, positive or negative.
 - Examples: $-\frac{\pi}{2}$, $\frac{3\pi}{4}$, e^2 , $100e^{-0.02293}$, etc.
- Includes decimals that are both non-terminating AND non-repeating, positive or negative
 - Examples: 0.1010010001..., or 0.101101110..., etc.

A Real number has more than one "_____" category:

Natural-Whole-Integer-Rational-Real

Whole-Integer-Rational-Real

Integer-Rational-Real

Rational-Real

Irrational-Real

- EXAMPLE:** Classify each real number as one or more of the following: natural number, whole number, integer, rational number, or irrational number. [1.1.7]

$$\frac{6}{1}, -\frac{6}{7}, \sqrt{11}, 0.\overline{25}, \pi$$

Let's go through this list of numbers one at a time, considering all the categories.

Number	Does it Simplify?	Categories of Numbers it's Classified
$\frac{6}{1}$	simplifies to 6	_____, real
$-\frac{6}{7}$	doesn't simplify	Fraction = _____, real
$\sqrt{11}$	doesn't simplify	Root that doesn't simplify = _____, real
$0.\overline{25}$	doesn't simplify	Repeating decimal = _____, real
π	doesn't simplify	Has π = _____, real

Notes Section 1.1 – Numbers, Data, and Problem Solving

- **EXAMPLE:** Choose to which group of sets the following number belongs. Be sure to account for ALL sets. $-\frac{1}{3}$ Choose the correct answer below. [1.1.1]
 - A. real numbers, rational numbers
 - B. real numbers, irrational numbers
 - C. real numbers, rational numbers, natural numbers
 - D. rational numbers, natural numbers, integers
 - E. irrational numbers, natural numbers

Common error: “Since $-\frac{1}{3}$ is negative, then it is an integer.” (INCORRECT)

Remember that an integer can be either positive or negative, but they are “_____” numbers, not fractions like this one. So, Answer ____ is incorrect.

Notice that Answers ____ and ____ include natural numbers, but those are just the basic counting numbers 1, 2, 3, But $-\frac{1}{3}$ is definitely not a counting number!

Since $-\frac{1}{3}$ is a simplified fraction, it MUST be a *rational* number, real number. (____)

B. Scientific Notation

1. Format for scientific notation: _____ (“stem” times “power of 10”)

- For the “stem,” c is somewhere between ____ (included) and ____ (excluded).
 - Written more simply: $1 \leq c < 10$
- For the “power of 10,” n is an _____.

2. Convert standard notation (“regular” number) to scientific notation

- **EXAMPLE:** Write the following number in scientific notation 276,000 [1.1.29]
 - Step 1. Start with all the leading nonzero digits; ignore trailing zeros: _____
 - Step 2. Insert a decimal point to create a stem between 1 and 10: _____
 - Step 3. Move from the *stem* decimal location to the *actual* decimal location.
 - Count the **number** of positions moved: ____ places
 - Note the **direction** moved: to the _____ (positive)
 - Step 4. Value of n (exponent on base 10) comes from Step 3: $n =$ ____ or just ____
 - Step 5. Write the number in scientific notation: _____

-
- **EXAMPLE:** Convert to scientific notation 0.000000051 [1.1.31]
 - Follow the same steps in a similar fashion as previous example.
 - Stem: ____; move ____ places _____ to get to actual decimal point. (ignore zero to left of decimal) In scientific notation: _____
-

Notes Section 1.1 – Numbers, Data, and Problem Solving

3. Convert scientific notation to standard notation (“regular” number)

- **EXAMPLE:** The distance from the planet Drendal to its moon Kronotor is about 9×10^5 meters. Express this distance in standard form. [1.1.43]
 - Step 1. Write down just the “stem” number. ____
 - Step 2. Use n (the “power of 10”) to move (or “_____”) the corresponding direction (positive RIGHT, negative LEFT) and number of decimal places. “hop” ____ places to the _____
 - Step 3. Drop a decimal point after completing Step 2.
 - Step 4. Fill in any vacant place values with a zero.
 - Step 5. Remove (“_____”) the decimal point from the original stem.
 - In standard notation: _____.

- **EXAMPLE:** Write the number in standard form. 7.902×10^{-6} [1.1-25]
 - Follow the same steps in a similar fashion as previous example.
 - From decimal point between 7 and 9, move ____ places to the _____, then fill with zeros.
 - In standard notation: _____
(note that the zero to the left of decimal point is a matter of visual clarity only)

4. Calculator computations involving scientific notation

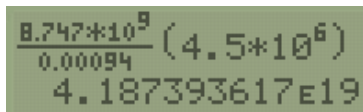

- **EXAMPLE:** Use a calculator to approximate the expression. Write the result in scientific notation.

$$\frac{8.747 \times 10^9}{0.00094} (4.5 \times 10^6)$$

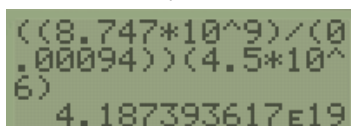

(Round to two decimal places as needed. Use scientific notation. Use the multiplication symbol in the math palette as needed.) [1.1.61]

- TI-84 has fraction feature: press ALPHA, Y=, ENTER

$$\frac{8.747 \times 10^9}{0.00094} (4.5 \times 10^6)$$
$$4.187393617E19$$

- TI-83 should use extra parentheses with fraction. Best to use separate ones for numerator, for denominator, and for entire fraction itself, so BE CAREFUL!

$$((8.747 \times 10^9) / (0.00094)) (4.5 \times 10^6)$$
$$4.187393617E19$$

- The short capital letter E with 18 at end is the power of 10, so “E19” means “ $\times 10^{19}$ ”
- Rounded to two decimal places: 4.19×10^{19}

Notes Section 1.1 – Numbers, Data, and Problem Solving

C. Percent Change – formula: Percent Change = $\left(\frac{\quad}{\quad} \right) \times 100\%$

- **Example:** Find the percent change if a quantity changes from P_1 to P_2 .

$P_1 = 1.4$ and $P_2 = 0.74$ (round to the nearest tenth as needed) [App.D.3]

- Since from P_1 to P_2 is _____, we expect the percent change to be _____.

- Use formula:

$$\text{Percent Change} = \left(\frac{P_2 - P_1}{P_1} \right) \times 100 = \left(\frac{\quad}{\quad} \right) \times 100$$

- Use calculator:

TI-84 $\frac{0.74-1.4}{1.4} * 100$
-47.14285714

TI-83 $((0.74-1.4)/(1.4)) * 100$
-47.14285714

- Rounded to the nearest tenth (one decimal place): _____%
