Notes Section 2.4 – More Modeling with Functions

Lesson Objectives

1. Modeling with Linear Functions
2. Applications with Linear Models
3. Piecewise-Defined (Linear) Functions

A. Modeling with Linear Functions

To model a quantity that is changing at a constant rate with $f(x) = mx + b$, the following formula may be used:

$f(x)$ = (________ rate of change, __________amount, or ______)·___+ (__________amount)

- The constant ________ of change (changing amount) corresponds to the _________ of the graph of *f*.
- The ___________ **amount** (starting or fixed amount) corresponds to the ___**-intercept**.

- **EXAMPLE:** Brand C soup contains 889 milligrams of sodium. Find a linear function *f* that computes the number of milligrams of sodium in *x* cans of Brand C soup. [2.2-28]

A. _____________ **your variables.** What information are we tracking?
Let *x* = _____________________________________
Let *f*(*x*) = ____

B. **Identify the ___________ amount (when ___ is zero).** Initial amount = ___
Notice the initial (or starting) amount is not explicitly stated in this problem.
Because we are counting *x* cans of soup, there isn't fewer than ______ cans of soup.
Also, with zero cans of soup, there's also _________ sodium.
So, it's reasonable to assume that the initial amount must be zero.

C. **Identify the _____________ amount (rate).** Changing amount = _______(increasing)
Since each can of soup has ________ mg of sodium, then the total sodium *f*(*x*) INCREASES by that amount, 889 mg, for each can of soup *x*.
The changing amount, then is +889 mg sodium.

D. **Write the _______________ for the linear function.**
$f(x) =$ _____________________________________
$\boldsymbol{f(x)} =$_______________ or more simply: ____________________

Notes Section 2.4 – More Modeling with Functions

B. Applications with Linear Models

- **EXAMPLE:** A 900-gallon tank is initially full of water and is being drained at a rate of 30 gallons per minute. Complete parts (a) through (d) below. [2.4.19]

(a) Write a linear function *W* that gives the gallons of water in the tank after *t* minutes.

A. **Define your variables:**

Let t = ___________ in minutes

Let $W(t)$ = ___________________________ after t minutes

B. **Identify initial amount:**

When t = _____, draining hasn't started yet, so tank is full at 900 gallons.

Initial amount = __________ (keywords: 900-gallon tank is initially ______)

C. **Identify changing amount (rate):**

The tank is ________________ at a ___________ of ________ gallons per minute.

Changing amount = ________ (keyword: draining, which is _________________)

D. **Write the formula:** $f(x)$ = (changing amount)·x + initial amount

So, the formula is: ______________________________

(b) How much water is in the tank after 4 minutes?

Use the formula you just found to compute this.

After 4 minutes means t = ______:

Use $\boldsymbol{W(t) = -30t + 900}$, with $t = 4$.

$W(4)$ = ______________________ = ___________________ = ____________

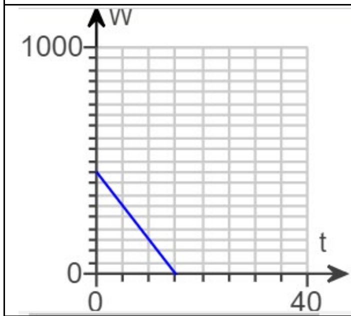
So, after 4 minutes, there are __________ gallons of water in the tank.

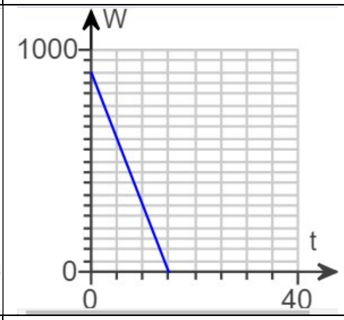
(go on to the next page)

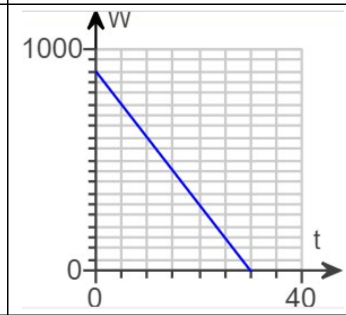
Notes Section 2.4 – More Modeling with Functions

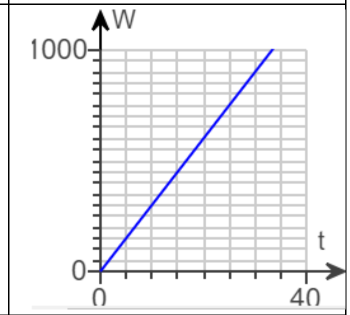
(c) Graph function *W* and identify and interpret the intercepts. Choose the correct graph below.

Recall from previous page that the function is: ***W*(*t*) = – 30*t* + 900**

A.	B.	C.	D.
			








The ***t*-intercept** is where ____________ (same thing as *y*) must be zero (that is _____ = 0).

Refer to the formula found earlier: $W(t) = -30t + 900$

Set *W*(*t*) equal to zero to find the *t*-intercept. $\_\_\_\_ = -30t + 900$

Now, solve the equation for *t*.

$$\frac{-900}{\quad} = \frac{-30}{\quad}t$$

So, the *t*-intercept is at $(\_\_\_\_\_\_, \mathbf{0})$. $\_\_\_\_\_\_ = t$

The ***W*-intercept** is where ___ = 0. Time = zero sec. (_____________amount of water in tank).

Refer to the formula found earlier: $W(t) = -30t + 900$

The *W*-intercept (or the *y*-intercept, *b*) is: $(\mathbf{0}, \_\_\_\_\_\_\_\_\_)$.

(d) **Find the domain of *W*.** (Use set-builder notation)

Remember that domain is ___, but with this function, the domain involves _____(time).

The tank ____________ draining at *t* = 0 minutes and it ___________ draining at *t* = 30 minutes.

So, the domain is: {t| __________________ }. (the time is _____________ zero and 30 minutes)

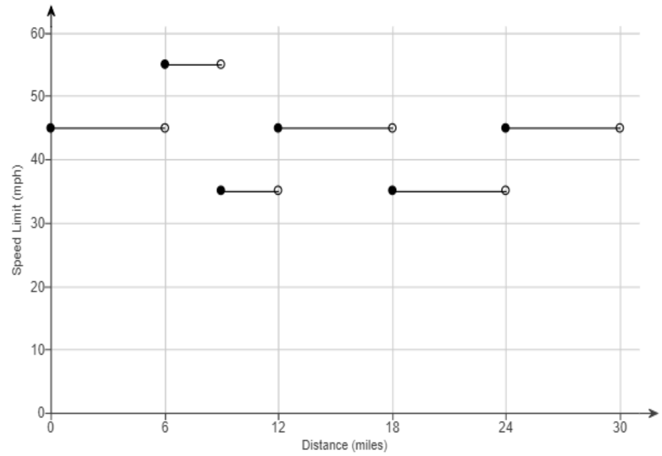
Notes Section 2.4 – More Modeling with Functions

C. Piecewise-Defined (Linear) Functions

- **EXAMPLE:** The graph of $y = f(x)$ gives the speed limit y along a rural highway x miles from its starting point. [2.4.27]

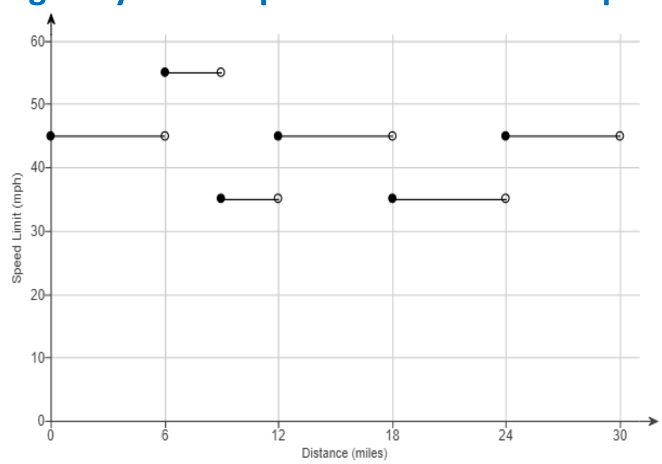
  (a) What are the maximum and minimum speed limits along this stretch of highway?
  (b) Estimate the miles of highway with a speed limit of 45 miles per hour.
  (c) Evaluate $f(9)$, $f(24)$, and $f(3)$.
  (d) At what x-values is the graph discontinuous? Interpret each discontinuity.

(a) What are the maximum and minimum speed limits along this stretch of highway?



Maximum speed limit = ____ mph Minimum speed limit = ____ mph

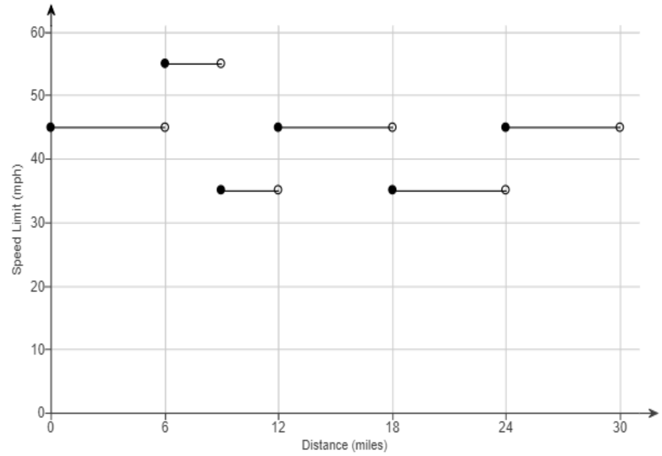
(b) Estimate the miles of highway with a speed limit of 45 miles per hour.



Estimated miles of highway with speed of 45 mph = ___ pieces × ___ miles = ____ miles

(go on to the next page)

(c) Evaluate $f(9)$, $f(24)$, and $f(3)$.



Use the ______________ dot, not the open dot!

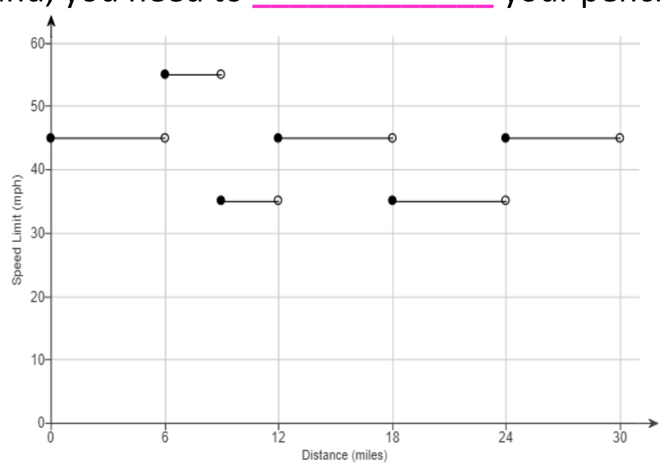
$f(9) =$ _____ The ____-coordinate when *x* = 9

$f(24) =$ _____ The ____-coordinate when *x* = 24

$f(3) =$ _____ The ____-coordinate when *x* = 3

(d) At what x-values is the graph discontinuous? Interpret each discontinuity.

discontinuous: where there is a "__________" in the graph, with another value ______________ it. If you were to graph by hand, you need to ______________ your pencil to continue the graph.



The graph is discontinuous at $x =$ ____________________

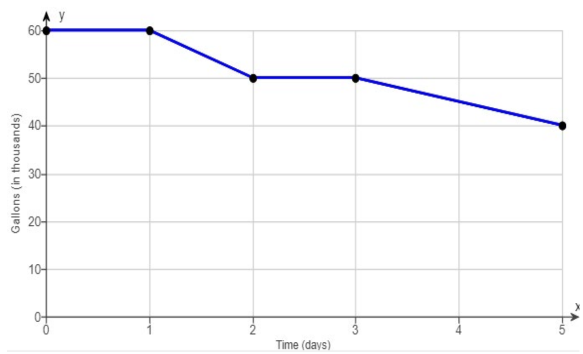
(NOTE: it is NOT discontinuous at $x =$ ______ because there is nothing following it)

(go on to the next page)

Notes Section 2.4 – More Modeling with Functions

- **EXAMPLE:** The graph of $y = f(x)$ shows the amount of water y in thousands of gallons remaining in a swimming pool after x days. [2.4.32]

(a) Estimate the initial and final amounts of water in the pool. (Type a whole number.)
(b) When did the amount of water in the pool remain constant?
(c) Approximate $f(2)$ and $f(4)$.
(d) At what rate was water being drained from the pool when $3 \le x \le 5$?

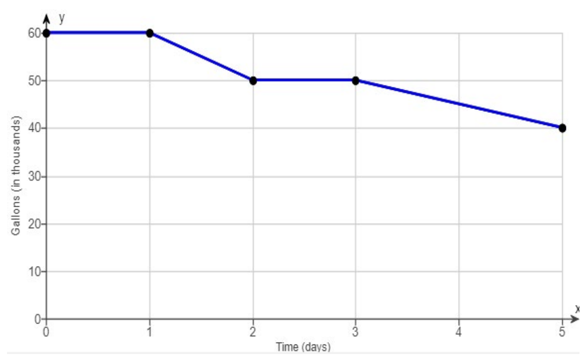


(a) Estimate the initial and final amounts of water in the pool. (Type a whole number.)

Recall that the initial amount is the y-intercept, b, so find that location in the graph:
The initial amount of water in the pool was____________________ gallons.
The final amount is the number of gallons seen at the end (far right) of the graph:
The final amount of water in the pool was ____________________ gallons.

(b) When did the amount of water in the pool remain constant?

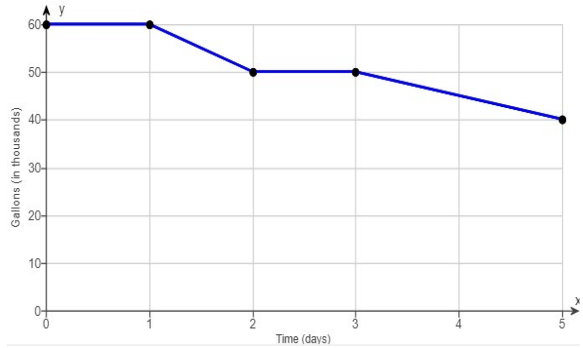
In the graph, a **constant** amount is ____________________ because it isn't changing.



Choose the correct answer below

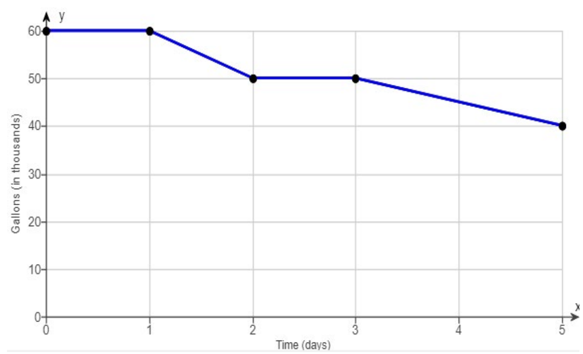
A. The amount of water in the pool was constant when $0 \le x \le 2$ and $2 \le x \le 4$.
B. The amount of water in the pool was constant when $0 \le x \le 1$ and $2 \le x \le 4$.
C. The amount of water in the pool was constant when $0 \le x \le 1$ and $2 \le x \le 3$.
D. The amount of water in the pool was constant when $0 \le x \le 2$ and $2 \le x \le 3$.

(c) Approximate $f(2)$ and $f(4)$.



$f(2)$ means find ___when ___ $= 2.$ (Use the graph) $f(2) =$______
This means that after 2 days, there are about 50,000 gallons in the pool.
$f(4)$ means find ___ when ___ $= 4.$ (Use the graph) $f(4) =$______
This means that after 4 days, there are about 45,000 gallons in the pool.

(d) At what rate was water being drained from the pool when $3 \leq x \leq 5$?



When $3 \leq x \leq 5$, that's between days 3 and 5. The **rate** is its slope.

$$\text{rate} = \text{slope} = \frac{\text{rise}}{\text{run}} = \underline{\hspace{6cm}} = \underline{\hspace{3cm}} = \qquad \frac{\text{gallons}}{\text{day}}$$

The water drained at a rate of __________ gallons per day when $3 \leq x \leq 5$.

(go on to the next page)

Notes Section 2.4 – More Modeling with Functions

- **EXAMPLE:** For the following function find the values of

  (a) $G(-18)$ **(b)** $G(3)$ **(c)** $G(-1)$ [*Bittinger 2.2.97]

$$G(x) = \begin{cases} x-4, & \text{if } x \le -1 \\ x, & \text{if } x > -1 \end{cases}$$

These are ______ restrictions

ALWAYS start here **first** with ______ part!

- Only ______ row "works" – the row you use **depends** on the ______ involved.
- Work backwards – test your value for x on the ______ side of each row

(a) $\boldsymbol{G(-18)}$ means ___ $= -18$. ______ **it** in the ______ (inequality) part first.

$$\boldsymbol{G(x) = \begin{cases} x-4, & \text{if } x \le -1 \\ x, & \text{if } x > -1 \end{cases}}$$

$-18 \overset{?}{\le} -1$ ______ – use the ______ row to plug in $x = -18$

$-18 \overset{?}{>} -1$ ______ – do ______ use the second row for $x = -18$

Using the FIRST row of the function, $G(x) =$ ______

$G(-18) =$ ______ $=$ ______

(b) $\boldsymbol{G(3)}$ means ___ $= 3$. **Test it** in the **domain** (inequality) part first.

$$\boldsymbol{G(x) = \begin{cases} x-4, & \text{if } x \le -1 \\ x, & \text{if } x > -1 \end{cases}}$$

$3 \overset{?}{\le} -1$ ______ – do ______ use the first row for $x = -18$

$3 \overset{?}{>} -1$ ______ – use the ______ row to plug in $x = -18$

Using the SECOND row of the function, $G(x) =$ ___

$G(3) =$ ___

(c) $G(-1)$ means $x = -1$. **Test it** in the **domain** (inequality) part first.

$$\boldsymbol{G(x) = \begin{cases} x-4, & \text{if } x \le -1 \\ x, & \text{if } x > -1 \end{cases}}$$

$-1 \overset{?}{\le} -1$ ______ – use the ______ row to plug in $x = -1$

$-1 \overset{?}{>} -1$ FALSE – do NOT use the second row for $x = -1$

Using the FIRST row of the function, $G(x) =$ ______

$G(-1) =$ ______ $=$ ______

Notes Section 2.4 – More Modeling with Functions

- **EXAMPLE:** The charges for renting a moving van are \$75 for the first 30 miles and \$5 for each additional mile. Assume that a fraction of a mile is rounded up.
  (i) Determine the cost of driving the van 84 miles.
  (ii) Find a symbolic representation for a function *f* that computes the cost of driving the van *x* miles, where $0 < x \leq 100$.
  (Hint: Express *f* as a piecewise-defined function) [*Lial 2.6-30]

[SOLUTION]

(Total = _____ miles) **Price**

First _____ miles → → → → \$_____

Miles remaining:

_____ − _____ = _____ \$____ × ____

After first 30 miles, price is = \$_______

\$_____ each additional mile

Total price: \$____ + \$_____

= \$______

ANSWER: ___

$$f(x) = \begin{cases} 75 & \text{if } 0 < x \leq 30 \\ 75 + 5(x - 30) & \text{if } 30 < x \leq 100 \end{cases}$$

Use ____ row: $f(x) = 75 + 5(x - 30)$

Test it!

$30 < 84 \leq 100$ is ________

$$f(84) = 75 + 5(84 - 30)$$
$$= 75 + 5(54)$$
$$= 75 + 270 = \$345$$

need to use _______ row because $x =$ _____ miles

A. \$6570; $f(x) = \begin{cases} 75x & \text{if } 0 < x \leq 30 \\ 75 + 5(x - 30) & \text{if } 30 < x \leq 100 \end{cases}$

B. \$645; $f(x) = \begin{cases} 75 & \text{if } 0 < x \leq 30 \\ 75 + 5(x + 30) & \text{if } 30 < x \leq 100 \end{cases}$

C. \$345; $f(x) = \begin{cases} 75 & \text{if } 0 < x \leq 30 \\ 75 + 5(x - 30) & \text{if } 30 < x \leq 100 \end{cases}$

D. \$645; $f(x) = \begin{cases} 75 & \text{if } 0 < x \leq 30 \\ 75 + 5(x - 30) & \text{if } 30 < x \leq 100 \end{cases}$
